Keywords: Automation Solutions Specialist, Digital Transformation Specialist, Low-Code Development (Dataiku, Alteryx), Data Modelling Specialist, AI-Assisted Application

Summary

12 years in financial services. Career path started in business operations, moving progressively into business automation and digital transformation.

Sits at the intersection of business logic and technical implementation: interpreting regulatory requirements against business realities, designing maintainable data models, and independently delivering end-to-end using low-code tools.

Core philosophy: simple data models, minimal intermediate steps, and systems built for long-term maintainability.

Methodology: question whether a requirement is valid; delete unnecessary steps; simplify and reorganize what remains; use tools to accelerate the process with full production testing; automate the process while keeping it maintainable long-term.

Experience

Full-time parenting | Singapore | 2025.07 – Present

- Paused full-time work due to family relocation and childcare needs for a young child
- Built a personal portfolio site independently using AI tools, and used it to document and present past project case studies (see homepage link above and GitHub project links below)
- Writing two Substack newsletters: [Notes from Nanyang](#), covering observations on life and society in Singapore, and [Uphill, Downhill, Unexpected](#), covering personal history and reflections

Standard Chartered Bank, China Head Office | Finance | Digital Manager | 2022.06 – 2025.07

Led the architectural redesign and automation of credit-related regulatory reporting for Standard Chartered China's Finance department, covering 900+ reports under two regulatory authorities' frameworks

- Designed a two-tier data model (a "3+6" architecture), decoupling business facts from regulatory requirements, replacing a setup where each report was maintained independently with no single point of control for rule changes; business data and regulatory logic could change independently of one another, reducing manual amend files by 70%
- Led the first production deployment of Dataiku at Standard Chartered China, delivering the full automation suite from design to go-live within 3 months, replacing a previously complex and inefficient manual workpaper process; built an automation suite with 50+ projects covering data ingestion, quality checks, variance analysis, and cross-report reconciliation, without IT team or external consultants at any stage
- Unified the underlying data source and built automated validation logic that resolved a long-standing reconciliation discrepancy between two related regulatory reports under the same reporting basis, saving 3+ FTE per month, completing submissions 48 hours ahead of deadline, and achieving 100% data consistency
- Expanded the framework from its original scope of loan-related reports into a general-purpose architecture across business lines, later adopted as the standard architecture for regulatory reporting automation within the Finance department
- Established a Confluence-based technical documentation system and led department-wide training, replacing a setup where knowledge was concentrated in one person with no documentation or training in place; designed the system to be maintained independently by business users, with handover to the Hub team completed with zero operational disruption

JPMorgan Chase Bank, Shanghai Branch | Operations | Reporting Group Lead | 2019.09 – 2022.06

Owned regulatory reporting and project management for the Shanghai Branch's cash operation, covering balance-of-payments reporting, anti-money laundering, cash transaction details, credit reporting, interest rate filings, and cross-border RMB reporting

- Leading the development of SOP documentation framework covering the team's core reports, including balance-of-payments and anti-money laundering, filling the gap that had persisted for a long time
- With overseas engineering teams down during the COVID-19 and no engineering support available, and Overdraft (OD) and Entrusted Loan (EL) reporting under significant pressure while lacking SOPs and consistent logic, self-taught Alteryx, translated regulatory requirements into data logic, and proactively redesigned the data standards and reporting workflow
- Built a five-layer data model (corporate customer, loan contract, loan note, loan transaction, guarantee contract) and rebuilt the entire operating process, shifting the data-processing granularity from monthly to daily; this moved risk exposure points from a month-end concentration to a daily process, turning exception handling from after-the-fact remediation into upfront prevention
- Reduced report preparation time from 6 days to 30 minutes, covering six major report categories across two regulatory reporting bases, enabling pre-submission cross-validation, with no IT resources required at any stage

Citibank, Shanghai Branch | Operations | Transaction Analyst | 2012.10 – 2019.08

Handled compliance operations and systems projects for Citi China's cash operations line, with scope expanding over time from front-line operations to business-side project ownership

- Started out handling document review and client communication for cross-border transactions; in 2015, took over balance-of-payments reporting and redesigned the data validation logic, cutting 2 process hours per day, and was recognized the same year as "Outstanding BOP Declaration Staff" by the Shanghai Branch of the State Administration of Foreign Exchange
- Took on related systems testing, then moved into a project liaison role for the cash operations department, leading the EAST 3.0 project and the balance-of-payments/anti-money laundering reporting system upgrade; as business-side owner, defined data logic, coordinated with local and overseas development teams, and led the process from UAT through to delivery
- Served as the China-side business lead on Citilean, Citi China cash operations' first large-scale business automation project, covering requirements analysis and data logic design for a paperless FX cash operations system and directing bank-wide stress testing; replaced a previously paper-based, manually reconciled workflow, delivering 85% paperless coverage, cutting balance-of-payments reporting time by 60%, and reducing document filing and sanction screening steps by 90%. The solution was later adopted as a technical standard by Citi Asia-Pacific and rolled out to branches across Southeast Asia and Russia

Education

Shanghai Normal University | College of Finance | Bachelor's Degree in Economics | 2008.09 – 2012.06

Skills

Tools: Dataiku (Advanced Certification), Alteryx (Advanced Designer Certification), SQL

Languages: Mandarin (native), English (working proficiency)
